## Testing curvature-induced in-vacuo dispersion with gamma-ray-bursts

Tuesday, 6 July 2021 09:30 (30 minutes)

We explore the phenomenological viability of scenarios, suggested by different approaches to quantum spacetime, where quantum-gravity effects in the propagation of particles are triggered by spacetime curvature/expansion. We rely on a toy model of curvature-induced Lorentz violation for a preliminary exploration, and we find that, differently from what commonly believed, the double suppression due to Planck-length and spacetime curvature is compensated by the high energies and the long (cosmological) distances traveled of the gammaray-burst photons.
