Sixteenth Marcel Grossmann Meeting

Contribution ID: 675

Type: Talk in the parallel session

Effective black hole interior and the Raychadhuri equation

Monday, 5 July 2021 18:45 (17 minutes)

We show that loop quantization leads to the emergence of defocusing terms in the expansion and its rate of change, the Raychaudhuri equation. These terms are suppressed in the region far from the singularity but dominate close to that region and prevent both the expansion and its rate from diverging everywhere inside the black hole. This in turn signals the disappearance of the caustic points and the resolution of singularity in the interior of the black hole.

Primary authors: RASTGOO, Saeed (York University, Canada); Dr DAS, Saurya (Department of Physics and Astronomy, University of Lethbridge); Mr BLANCHETTE, Keagan (York University, Canada); Ms HERGOTT, Samantha (York University, Canada)

Presenter: RASTGOO, Saeed (York University, Canada)

Session Classification: Loop Quantum Gravity: Cosmology and Black Holes

Track Classification: Quantum Gravity: Loop quantum gravity: cosmology and black holes
