

## **Shadows around at Sgr A\* and M87\* as a tool to test gravity theories**

*Friday, 5 November 2021 12:50 (30 minutes)*

The shadow around the supermassive black hole in M87 was reconstructed in 2019 based on its observations with the Event Horizon Telescope in 2017. Recently polarization map for the M87\* shadow was presented. We discuss opportunities to evaluate parameters of alternative theories of gravity with shadow observations, in particular, a tidal charge could be estimated from these observations.
