

Bayesian Time-resolved Spectral Properties in the BdHN GRBs

Wednesday, 18 May 2022 11:40 (20 minutes)

The binary-driven hypernova (BdHN) model has been successfully applied to explain the observed properties of multi-band gamma-ray bursts (GRBs) for many years. Here we report the spectral properties of the prompt emission of 21 BdHN bursts and their multi-wavelength afterglow properties.
