Detection of Exotic Compact Objects with Extreme Mass Ratio Inspirals and mini-EMRIs

Friday, 12 July 2024 15:20 (20 minutes)

I will discuss the detection of exotic compact objects, such as primordial black holes, boson stars, etc, with gravitational waves from a binary system where the mass ratio is extremely small (or large), and show that such extreme mass ratio inspirals and mini-EMRIs are ideal systems for detection of very light exotic compact objects, and that they serve as important targets for space-based and terrestrial gravitational wave detectors.
